Github Repository: https://github.com/mwong120/CMSC320-Final-Project

Dataset: https://archive.ics.uci.edu/dataset/555/apartment+for+rent+classified

       We are choosing this dataset because it is very large at 100,000 rows and also provides a lot of information about each apartment with 22 columns. The data is also very organized and well cleaned, making it easy to manipulate and use since we won't have to manually enter data in ourselves. We want to use this dataset to see where apartments are the most expensive per square feet and what affects this price like pets being allowed or amenities like a gym or pool.
